EDUCATION AND OTHER ACTIVITIES:

Since 1998, Fonseca has been the Director of the NSF Center for Nonlinear Analysis (CNA, DMS 9803791) in Carnegie Mellon University. The activities of the CNA may be found at <http://www.math.cmu.edu/cna/index.html>. These include maintaining a series of scientific reports, weekly

seminars, weekly working groups, a visitors' program, the organization of conferences, workshops and summer schools, networking with other research institutions in the US and abroad, and developing mobility, interchange, and internationalization programs for CNA trainees and research faculty.

SYNERGISTIC ACTIVITIES

Internationalization and bridging with other research groups and institutions are key to keep abreast of recent developments in applied analysis, to be in position to identify cutting-edge mathematical questions, and to be a worldwide asset in the training of postdoctoral fellows and graduate students, cognizant of research opportunities at the interface between mathematical and physical sciences and engineering. As Director of the CNA since 1998, Fonseca is actively engaged in searching for new opportunities, facilitating already existing collaborations, and fostering the building of new bridges across different institutions in the US and in Europe, thus guaranteeing and securing its reputation as a national and worldwide asset in the education and training of a new generation of researchers who will be at the forefront of mathematics, well informed and well positioned to respond to mathematically challenging areas of materials science, solid state physics, and biotechnology. With these partnerships the CNA seeks to facilitate already existing collaborations and to search for new opportunities including co-organization of conferences and workshops, co-organization of summer schools, mobility for postdocs and advanced graduate students.

- Fonseca was the PI of the 5 million dollars/5 year award of the National Science Foundation funded PIRE (Partnerships for International Research and Education) on "Science at the Triple Point Between Mathematics, Mechanics and Materials Science" (<http://www.math.cmu.edu/PIRE/>) that expired in Fall 2017. Many contemporary problems in new advanced materials relate to variation in length, time scales, and variations inherent in their fabrication and function. Resolution of these problems requires predictive theories for these complex systems that in turn require advances in mathematics. In this PIRE project an international network of prominent mathematicians from four U.S. institutions, five European institutions, and a multinational industrial partner, built on decades of collaboration and training at the interface of mathematics and materials sciences that have yielded many achievements at the forefront of sophisticated new mathematics and simulation methods. The project focused on four principal research areas: 1. Pattern formation from energy minimization, 2. Challenges in atomistic continuum modelling and computing, 3. Prediction of hysteresis (system that have "memory" such that effects of stimuli are temporally delayed), and 4. Pattern dynamics and development of material microstructure.

Collaborators on this PIRE project included four U.S. institutions: Carnegie Mellon University (PA), California Institute of Technology, New York University, and University of Minnesota; six European institutions: University of Antwerp (Belgium), University of Bonn (Germany), Max Planck Institute for Mathematics in the Sciences (Germany), International School for Advanced Studies (SISSA)(Italy), University of Oxford (UK), and the University of Warwick (UK); and an industrial partner: Robert Bosch GmbH (Germany and USA).

- International School for Advanced Studies (SISSA) in Trieste. This is an exchange agreement of faculty and trainees with the SISSA in Trieste, beginning in 2005 and renewed in 2011 and in 2016.
- The University of Naples (Italy) and the CNA signed an agreement in 2012 to facilitate the mobility of young researchers between the two institutions.
- In 2012 the Center for Nonlinear Analysis agreed to participate as associate organization in the research project "Mechanics of Complex Materials", managed by the Italian Ministry of Education, University and Research, under the scientific responsibility of Professor Cesare Davini as coordinator of the Research Unit of Udine (Italy). This agreement was also extended to the University of Trento (Italy), under the same grant proposal.
